

README:

Article Title: “The Diffusion of State Firearm Regulations”

Author: Nicholas Hemauer

Computing Environment:

- Windows 11
- 64 GB RAM
- 4.7 GHz 8-core Processor
- RStudio ver. 4.2.2

Replication Runtime:

- For figures in the manuscript, it takes roughly 2-3 hours
- Appendix model 1 takes roughly 45 mins
- NOTE: Network Event History Analysis (NEHA) is very RAM-intensive; more cores equals more RAM

Scripts/Files:

- “NEHA_Execute.RMD” is the file that includes all analyses

- There are 3 datasets; each dataset is the same data, but each is transformed differently
 - “Final_Long_Dataset.csv” is used to create the summary statistics (Table 3)
 - “Final_Long_Scaled_Dataset.csv” is used for the NEHA analysis (Models 1-3). This dataset’s covariates are scaled (mean 0 sd 1).
 - “Final_Long_Scaled_Dataset_Lag.csv” is for Appendix Model 1. This dataset is scaled and includes a lag for the “Neighbor_Adopt_Prop” variable.

- Additionally, there is a “Presidential_Results_2020.csv” file used for creating the NEHA visualization colors (Figure 3)

Dependencies:

- I use these libraries from CRAN in my script:
 - library(haven)
 - library(tidyverse)
 - library(summarytools)
 - library(patchwork)
 - library(ggplot2)
 - library(maps)
 - library(glmmTMB)
 - library(xtable)
 - library(texreg)
 - library(scales)
 - library(ggeffects)
 - library(igraph)

-The last dependency is the NEHA package from Desmarais Lab on Git. That package can be found here: <https://github.com/desmarais-lab/neha>

-NOTE: It's NECESSARY that rJava is installed. This requires the Java Development Kit (JDK) to be installed on the computer/HPC. This can be finicky on HPCs and will depend on the Linux environment.

-rJava CRAN notes that JDK 1.2 or higher (the GNU make) must be used

-<https://www.oracle.com/java/technologies/downloads/>
